Canon EOS 60D Rubber grips Replacement

Removing the rubber grips is required to get in the camera itself. Its a pretty simple process, and is not really camera specific.

Written By: Eric D

INTRODUCTION

The grips for the 60D come off easy, they just peel off. For many 60D owners, Canon already helped you by choosing a poor / defective adhesive for the first few batches of cameras shipped.

TOOLS:

- Spudger (1)

Step 1 — Rubber grips

- Use a thin piece of plastic, spudger, or fingernail (if you have them) to lift up the edge of the grip, and pull up slowly.
- Repeat for the other two grips
- The large one on the battery-side is the easiest to start with. This is required to remove the front & back panels
- The small one on the back is a bit difficult to get started, but not really difficult to remove.
- The one on the AV panel will be easier if you open up the AV port cover.
- Remove the adhesive like you would rubber cement, just rub your finger against it, it will come off.
- Optionally throw the balled up adhesive at people pretending its a booger :)

Double stick tape, or rubber cement (placed carefully) should work well. Studio-mount (sheets of double-stick tape) cut to size should also work.
